

Paraclipse®

Our amazing

CAPTURE CARTRIDGE

Paraclipse Systems patented auto-advancing cartridge is revolutionary! It is the answer to all the inefficient and unsanitary limitations of the standard glue boards & “Zappers.” Using a patented, 30-60 day auto-advancing cartridge system, Paraclipse units have a small motor that slowly advances the glue ribbon, eliminating frequent checks to see if the glue surface is full. Our decorative systems use UV light and other natural attractants to draw insects to the glue surface where they stay for good!

No matter which Paraclipse insect control system you choose, our Capture Cartridge™ constantly provides fresh attractants and a clean surface to catch and encapsulate flies and other insects. Replacing a used cartridge could not be simpler and more sanitary. A tone alerts the user that the glue surface and captured insects have all been rolled up into one end and can be safely and easily disposed of without any sticky glue mess. Simply slide a new replacement cartridge into the unit and it is ready to provide another 30 to 60 days of insect control (depending on the system you are using).

Paraclipse illuminated insect control systems avoid the problems of other fly control methods, while offering an effective solution that is clean, “green” and better designed for public spaces.

Why choose our Capture Cartridge?... Simple!

- Cartridge life is 30-60 days
- 10 to 20 times more insects than standard glue boards.
- No pesticides or insecticides.
- USDA & FDA approved
- Natural attractants, sex pheromones and decoys designed specifically to capture more insects.
- Highly effective and a very economical
- Clean, “green” and sanitary
- No “Zapping”, noise or mess

Why our units are Superior.

- Bug zappers cause a mist containing insect parts that can spread up to 7 feet (2.1 m) from the device.
- The air around the bug zapper becomes contaminated by bacteria and viruses that can be inhaled or settle on food in the immediate vicinity.
- Glue boards usually become ineffective after a few short days as the UV light dries out the glue and dust, grease and insects coat the surface which allows flies to escape. They also must be removed by hand.
- Chemical fly control systems are toxic and pose a risk of contamination.
